10:30 From project to product - more residential construction through standardization

There is already a shortage of more than 700,000 apartments in Germany today, and the trend is rising! This immense demand can only be met through the systematic use of standardization and digitalization in project development. nyoo is convinced that the majority of residential construction will be characterized by a consistent product approach in the future.

13:30 Smart Buildings - Vision and Truth of Modern Buildings

Smart buildings have become increasingly popular in recent years, but there is still disagreement about their definition and added value. The perspectives of users, investors and other stakeholders differ widely. The question of whether the initial investments are worthwhile in the long term remains unanswered. The lack of a uniform understanding of the market makes it difficult to assess smart buildings. A recent study involving experts has collected empirical data on this topic for the first time.

16:00 The climate transition has arrived - lessons learned for the steps ahead.

In recent years, the real estate industry has focused intensively on the topic of ESG and climate impact - it is clear that climate-friendly properties will be easier to rent and sell in the future. However, measurability, implementation and communication remain a major practical challenge. This presentation looks at key findings from recent years, translates them into concrete steps forward and provides impetus to take them.

10:30 Efficient construction through value engineering and optimal use of construction software

The construction industry plays a key role for Germany and has a major influence on economic development. However, compared to other industries, the construction industry has fallen behind in the areas of productivity, occupational safety and sustainability. This is partly due to the slow implementation of BIM (Building Information Modeling) and the low level of investment in IT and software to digitize key business processes. In addition, many existing software offerings do not meet the specific requirements of the construction industry.

In this presentation, we will show how Hilti can contribute to digital design and construction and digitalization with a new portfolio of construction software solutions.

ZUGSPITZE
MASTERCLASSES

10:45 How to create a visual time machine for your construction project

Are you still documenting your projects manually with smartphone photos in cluttered folders only to realise later that you haven't taken that one photo you desperately need? Do you sometimes wish you could go back in time to take another look behind an installed wall or under a laid floor? Then this session is for you!

Sander Lijbers from OpenSpace showcases practical examples on how to create a full visual representation of your project to compare progress over time as well as your current site progress to your BIM model (if you have one).

11:15 The secret to a successful BIM setup: Solve today's challenges for tomorrow's innovative BIM processes!

New regulations in the area of sustainability such as life cycle assessment, EU taxonomy and material building passports pose major new challenges even for highly developed BIM set-ups of major players. The presentation will highlight current developments and shed light on solutions that will enable small and medium-sized companies to master this major task with BIM in the future.

11:30 EU taxonomy: How wastebox helped the construction site to become compliant.

Mandatory sustainability reporting (Corporate Sustainability Reporting| ESRS & EU Taxonomy) presents many companies with new challenges. As the largest waste producer and major consumer of resources as well as a significant CO2 emitter, the construction sector is particularly challenged here. Transparency, data and know-how as well as proactive management of the construction site are required to achieve the targets.

Using a practical example, Sebastian Pill, Managing Director of wastebox.biz, explains the role that professional waste management plays in this and what it actually takes for a construction site to actually meet all EU taxonomy criteria. Taking a few factors into account at the beginning of the construction project saves time, money and nerves - right from the start.

MASTERCLASSES

12:00 The introduction of the BIM method requires not only technological adjustments, but also a cultural change in collaboration

Stefan's masterclass will look at the challenges and opportunities that the implementation of Building Information Modeling (BIM) brings to the construction industry. It will address how the introduction of BIM not only means adapting to new technological tools, but also requires a change in the culture of collaboration. The participants of the presentation will gain an insight into what Adolf Würth GmbH & Co KG has to offer to change the traditional working methods and communication structures in the construction industry through the introduction of BIM.

11:00 Digital Twins: Optimal use of data in planning, construction and operation

Planning, construction and operation are often still insufficiently networked, even when it comes to digital solutions. As a result, a lot of valuable data is lost - especially during the handover from construction to operation. This masterclass provides an overview of the Nemetschek Group's intelligent solutions for the individual stages of a building project and introduces the new Nemetschek dTwin platform, which brings together data from all phases of the lifecycle of a building project in a digital twin that can be used for the operation phase, where it improves decisions through real-time insights.

13:30 With digital ecosystems and AI towards portfolio

Double the renovation rate and halve CO2 emissions. This summarizes the requirement for the German residential building stock by 2030. In order to achieve this goal, the strategic management of modernizations along the entire chain must become simpler, faster and more efficient. This is exactly where digital ecosystems and AI will help us in the future. Why wait? Take a look at what this future looks like. How such systems are already significantly reducing complexity and effort. And, above all, what economic impact they will have.

15:00 ESG Alliance: Sustainability becomes a business case

There is no alternative to implementing sustainability measures across all portfolios in order to maintain or increase real estate values. For asset managers, too, this has become existentially important for their business model. Nevertheless, asset managers' sustainability initiatives often falter, mostly due to a lack of operationalizable sustainability strategies and the efficient and cross-portfolio planning, optimization, management and implementation of specific ESG measures.

This is precisely where the ESG Alliance comes in: The ESG Alliance pursues a holistic and digital approach in order to (1) collect end-to-end sustainability

(2) evaluate the data for the development of cross-portfolio sustainability strategies and prepare it in a standardized way for reporting, and (3) manage the implementation of the strategies in line with portfolio management.

This is achieved by linking established (state-of-the-art) technology solutions in terms of content and technology to create a holistic "ESG engine" with the aim of protecting and increasing the value of real estate assets. This means that sustainability in the real estate industry is no longer a pain point, but a business case.

09:30 Digital Rail Germany - The digitization of rail needs strong partnerships

With Digital Rail Germany, we are bringing future technologies to the rail system. A complex, long-term and highly innovative project: that is the digitization of the rail system. This joint task requires many different competencies - which is why Digital Rail is an initiative of the entire rail sector. To achieve the goal of a digital rail system, new digital technologies must be introduced and interact smoothly in the system. We are implementing technologies in practice in numerous pilot projects - in the rail sector and together with industrial companies and university and research institutes.

10:30 Communication in the life cycle of the built environment with immersive visualization techniques

With the increasing complexity of construction tasks and the growing number of stakeholders to be involved, comprehensible and well-integrated communication technologies are gaining in importance and are becoming a decisive success factor in the upcoming transformation of our built environment. Based on end-to-end digital processes and the data available in this way, visualizations can be derived at any time that can be used for immersive communication formats with increasingly established augmented and virtual reality systems. Regardless of how the future of the internet develops towards the metaverse, distributed working in the digital twin of our built environment will play a key role. The journey towards this is already beginning!

15:00 Sustainability - A positive impulse for the construction industry

The construction industry creates the foundations of our society and makes life worth living. At the same time, the industry faces many challenges and deficits that have not improved sufficiently over the years. These challenges are now increasingly being compounded by sustainability. For some, the new regulations, ratings and necessary adjustments seem like an impossible task. Yet sustainability is exactly what we need - an impetus for a long overdue transformation of the construction industry. Collaboration, a life cycle approach, digitalization and innovation are key enablers for a successful sustainable future and at the same time the right solutions for the classic challenges.
